

Career potential is lost when evidence and action arrive too late.

CareerOS connects student evidence, employer demand, and university action so gaps can be addressed earlier.

Signal → Evidence → Decision → Action → Learning

Prototype • simulated intelligence

The same evidence gap appears as uncertainty, recruiting waste, and late action.

STUDENT

Experience exists, but proof and direction do not.

Chris is a Year 3 Data Science student with projects and leadership evidence—but weak visibility into what those experiences prove and what to do next.

Consequence: option loss

EMPLOYER

Every urgent search restarts from zero.

Prior challenge participants, screening rationale, and relationship history decay across spreadsheets, inboxes, and disconnected systems.

Consequence: relationship loss

UNIVERSITY

The intervention window closes before the report arrives.

Programme and readiness gaps surface across departments while the current cohort cannot wait for a full curriculum cycle.

Consequence: time loss

Different symptoms. One failure: useful signals are fragmented, weakly evidenced, and remembered too late.

Existing tools optimise transactions—not continuity between them.

The next decision begins without the earlier context.

CareerOS preserves context between transactions; it does not pretend to replace every source system.

CareerOS converts fragmented signals into a sequence of earlier decisions.

Student evidence

Employer demand

University action

The prototype demonstrates each workspace and selected handoffs. A live shared network remains future-facing.

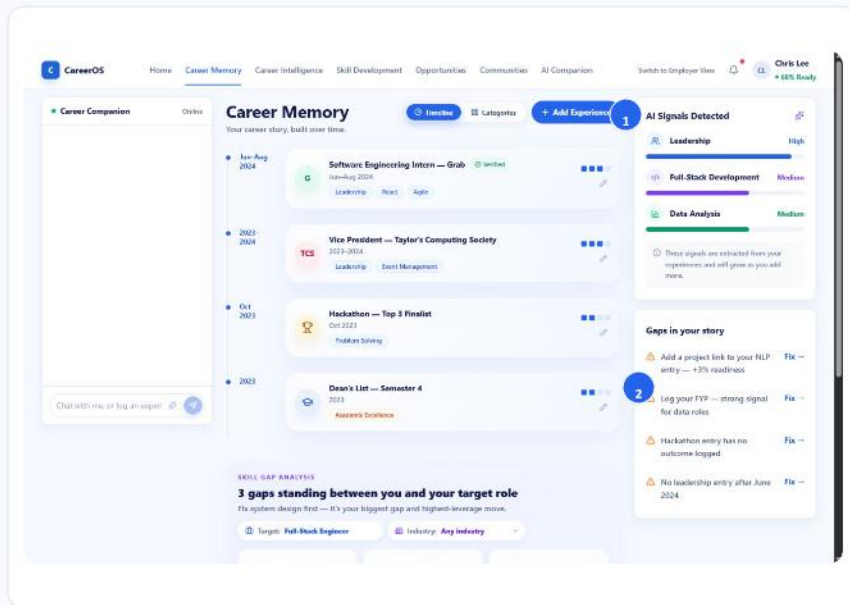

Career Memory turns “I did this” into “Here is what proves.”

PAIN → EVIDENCE

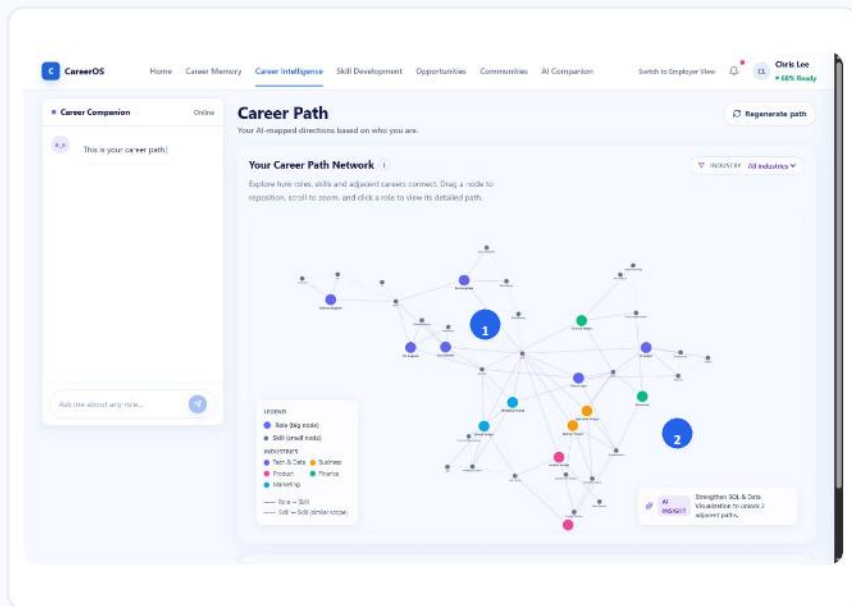

Students should not reconstruct their value only when an application opens.

- 1 Preserve projects, internships, leadership, events, and achievements.
- 2 Connect each experience to skills and supporting context.
- 3 Expose missing proof instead of hiding uncertainty.

Behaviour change: maintain reusable evidence continuously.

The Data Science degree becomes a starting signal—not a career boundary.

EVIDENCE → DIRECTION

Career Intelligence interprets existing proof against adjacent paths and gaps.

- 1 Reveal transferable evidence and adjacent career options.
- 2 Prioritise one missing skill or proof point.
- 3 Connect the gap to learning or market action.

Designed impact: clearer choices and less degree lock-in.

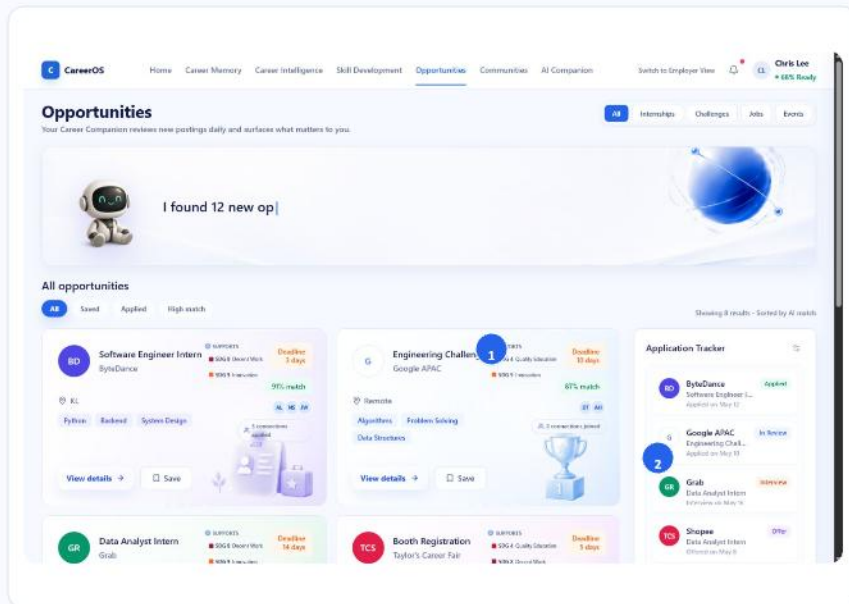

Guidance matters only when it ends in a visible next action.

DIRECTION → ACTION

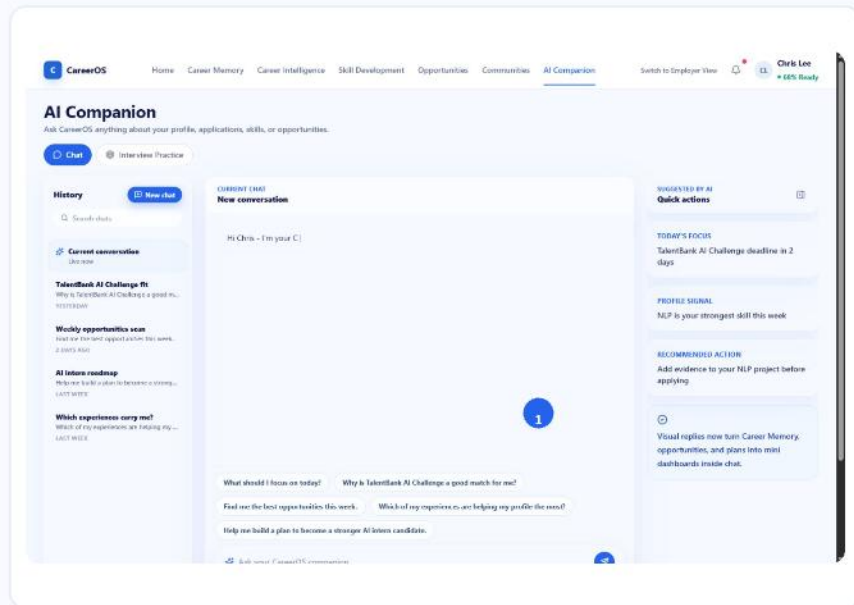

Opportunities and applications operationalise the student's next decision.

- 1 Explain why an opportunity fits—and what evidence is missing.
- 2 Save, apply, prepare, or build the needed skill.
- 3 Preserve status and follow-up instead of losing momentum.

Behaviour change: advice becomes a commitment.

Ask from intent, then practise the moment that matters.

INTENT → PREPARATION

The Companion reduces navigation while practice turns guidance into rehearsal.

- 1 Interpret the student's question in CareerOS context.
- 2 Route to evidence, opportunity, or preparation.
- 3 Practise for a role without learning the product's information architecture.

Expected impact: faster movement from uncertainty to preparation.

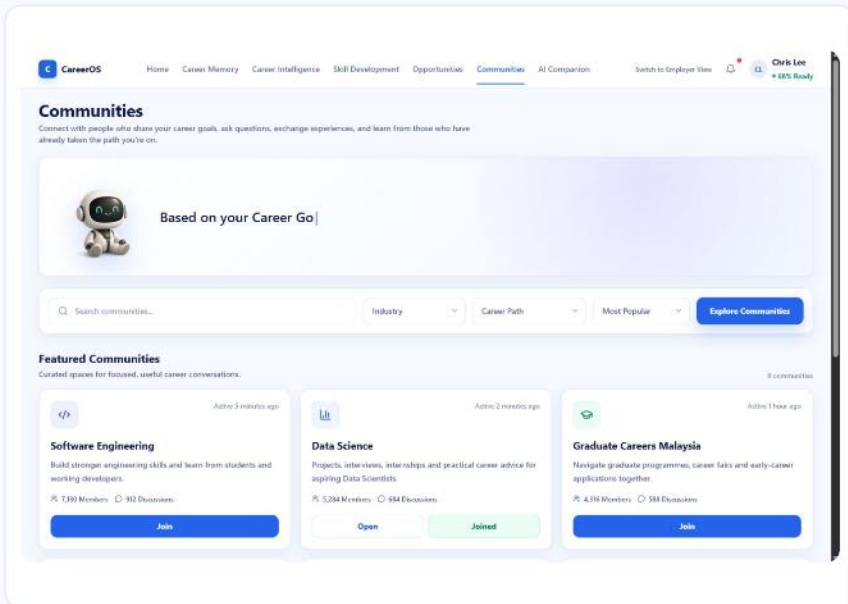

CareerOS gives students reasons to return between applications.

SETBACK → RETURN

Community, mentorship, and learning can extend the relationship beyond vacancy browsing.

- 1 Normalise rejection and uncertainty through relevant peers.
- 2 Find targeted support, advice, or mentorship.
- 3 Turn new activity into future Career Memory evidence.

Designed impact: continued evidence-building—not measured retention.

Employers need evidence and history—not another candidate database.

THE CURRENT FAILURE

Early-talent decisions are weakest when every search starts from CV claims and zero context.

Similar claims • limited work history • lost event context • urgent sourcing

THE CAREEROS EMPLOYER MODEL

Need

Evidence-backed discovery

Targeted validation

Decision history

Reusable pipeline

Behaviour change: ask what supports fit—and what must be validated.

A match should explain the evidence—and the uncertainty.

The screenshot displays the CareerOS Talent Discovery interface. At the top, there's a navigation bar with links to Home, Talent Discovery, Candidates, Engagement, Campus Pipeline, and Analytics. The main section is titled 'Talent Discovery' and shows 'Your active postings' with four job listings: Software Engineering Intern, Data Analyst Intern, AI & Data Challenge 2025, and Backend Engineering Workshop. Each listing includes details like location, dates, and application statistics. Below these, a summary states '8 of 47 applicants meet your hiring criteria for Software Engineering Intern. Top pick is Ivan Lim — 96% match with your project evidence and available June 2 candidates have expiring availability by tomorrow — act today.' A 'Contact top 3 now' button is present. The bottom section shows 'AI Shortlisted' candidates, with a detailed profile for Ivan Lim. His profile includes a 96% match score, a list of skills (Full-stack project verified, Attended your AI workshop, Leadership experience), a risk assessment ('Considering other offers — not fast'), and a validation note ('Validated: Strong design problem-solving ability'). A 'Shortlisted' button is at the bottom of his profile.

NEED → EXPLAINABLE FIT

Talent Discovery reframes ranking as an evidence-led validation plan.

- 1 Start from a hiring need, not a generic candidate search.
- 2 Show supporting evidence, strengths, and gaps.
- 3 Prepare the next validation question before shortlisting.

Designed impact: more structured, accountable screening.

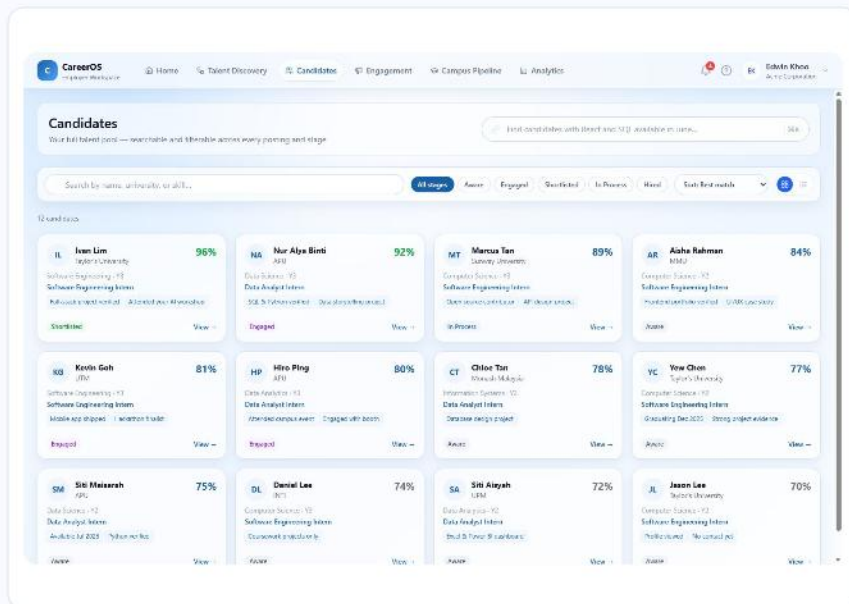

CareerOS preserves why a candidate moved—not only where they are.

FIT → DECISION HISTORY

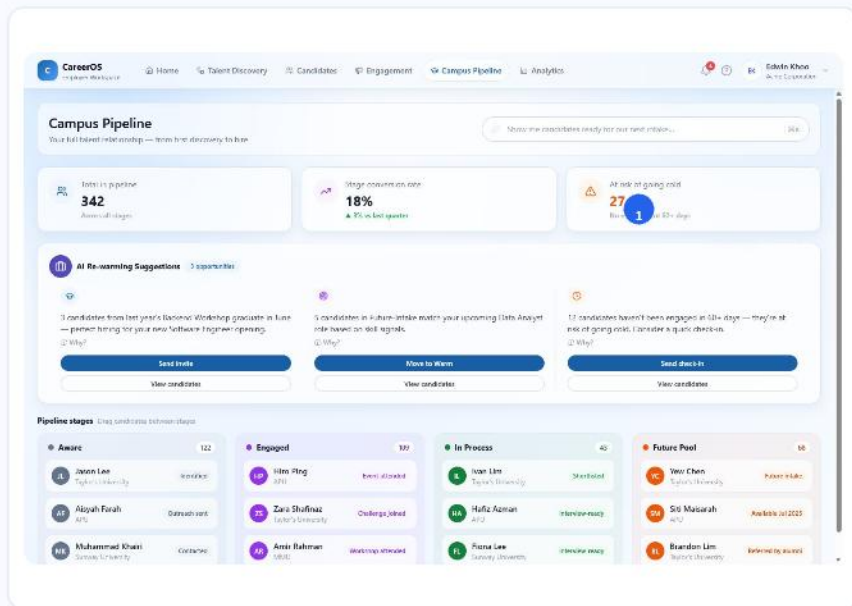

Evidence rationale must survive the handoff into candidate stages and team review.

- 1 Retain shortlist or pass decisions with context.
- 2 Carry gaps and validation questions forward.
- 3 Keep the next decision-maker from repeating the same review.

Expected impact: cleaner handoffs; ATS integration remains future.

Prior engagement becomes a renewable talent asset.

HISTORY → REACTIVATION

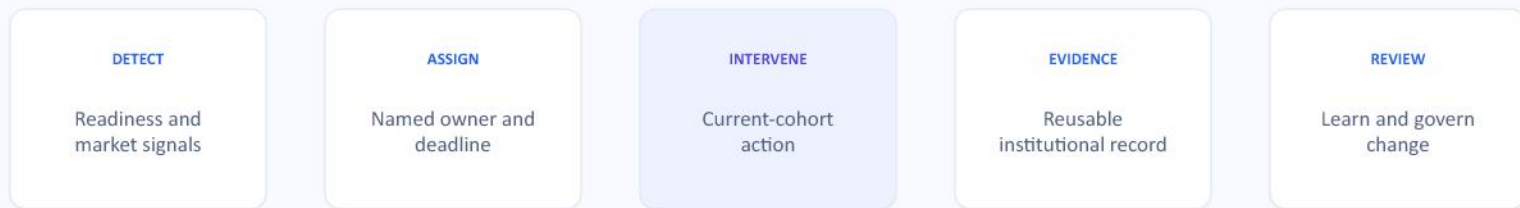

An urgent vacancy should not erase every previous challenge or candidate interaction.

- 1 Surface warm candidates with prior relationship context.
- 2 Explain why the renewed need matches earlier evidence.
- 3 Reconnect engagement design, pipeline action, and learning.

Designed impact: restart from context—not from zero.

Universities need time to act—not another annual report.

By the time an outcome appears in a report, the current cohort may already have lost the intervention window.

Critical principle: help the current cohort now while governing longer-term programme change.

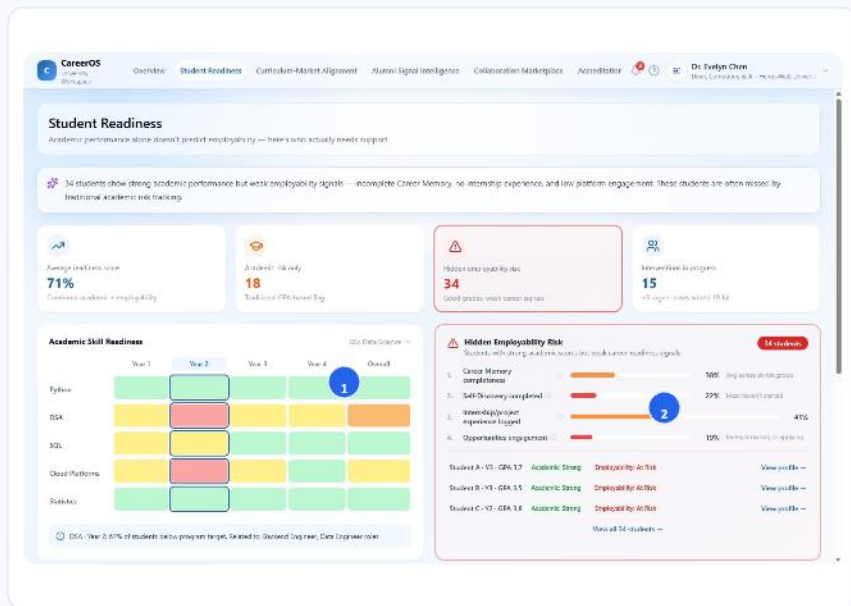

A risk signal matters only when someone owns the next intervention.

SIGNAL → OWNERSHIP

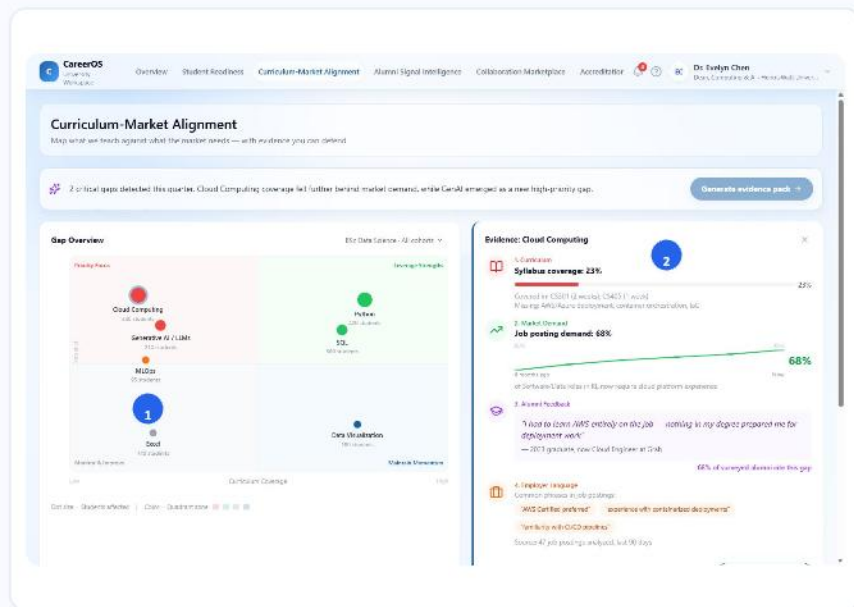

Student Readiness links cohort evidence to an accountable action.

- 1 Separate academic and employability signals.
- 2 Drill into a cohort or student risk context.
- 3 Assign an intervention, owner, deadline, and status.

Safeguards required: consent, access, correction, and fairness.

A curriculum gap needs two clocks: help now, reform properly.

DEMAND → TWO ACTIONS

Curriculum-Market Alignment separates current-cohort support from governed programme change.

- 1 Trace the gap to demand, coverage, and outcome signals.
- 2 Act now through workshops, challenges, or partnerships.
- 3 Build the evidence pack and roadmap for formal reform.

Behaviour change: market intelligence becomes a prioritised response.

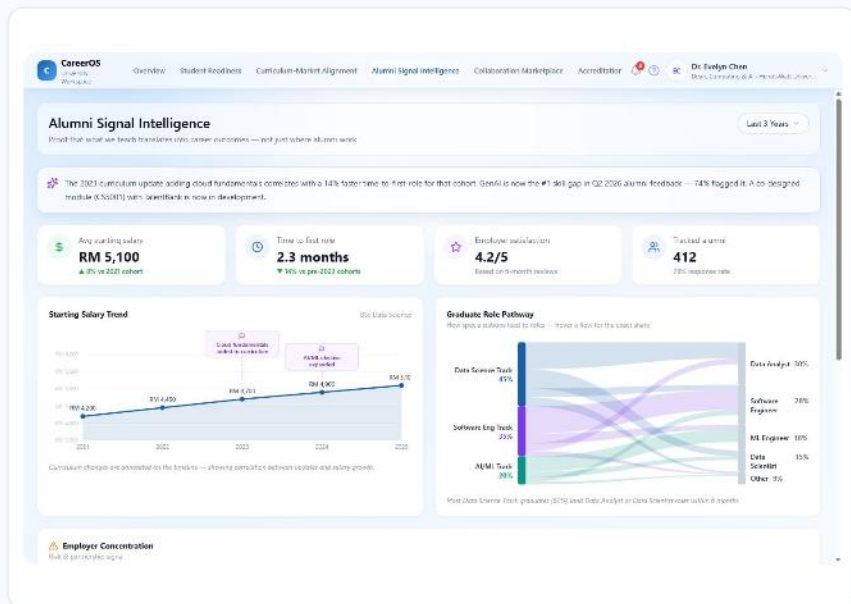

Alumni feedback needs an action channel—not another endpoint.

OUTCOME → PARTNERSHIP

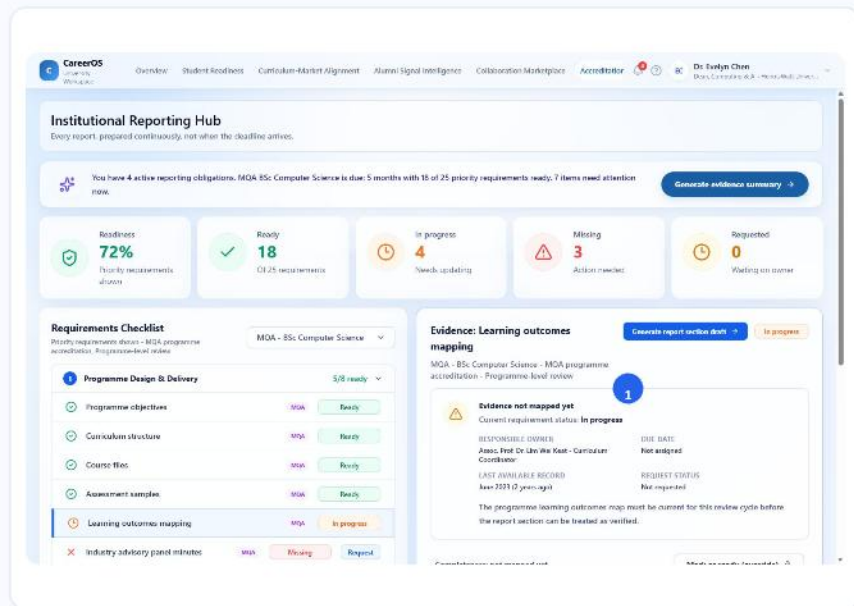

Alumni Signals and collaboration workflows connect learning to a named response.

- 1 Identify patterns worth investigating, not causal proof.
- 2 Route findings into curriculum or partnership decisions.
- 3 Design collaborations against a gap and preserve event evidence.

Designed impact: more purposeful partnerships and outcome learning.

Institutional evidence should not be rebuilt for every deadline.

ACTION → REUSABLE EVIDENCE

The Accreditation Hub models readiness, ownership, gaps, and evidence reuse.

- 1 Map requirements to source, owner, period, and completeness.
- 2 Expose missing evidence and the responsible person.
- 3 Reuse curriculum, readiness, alumni, and partnership evidence.

Designed impact: less repeated preparation; savings are not measured.

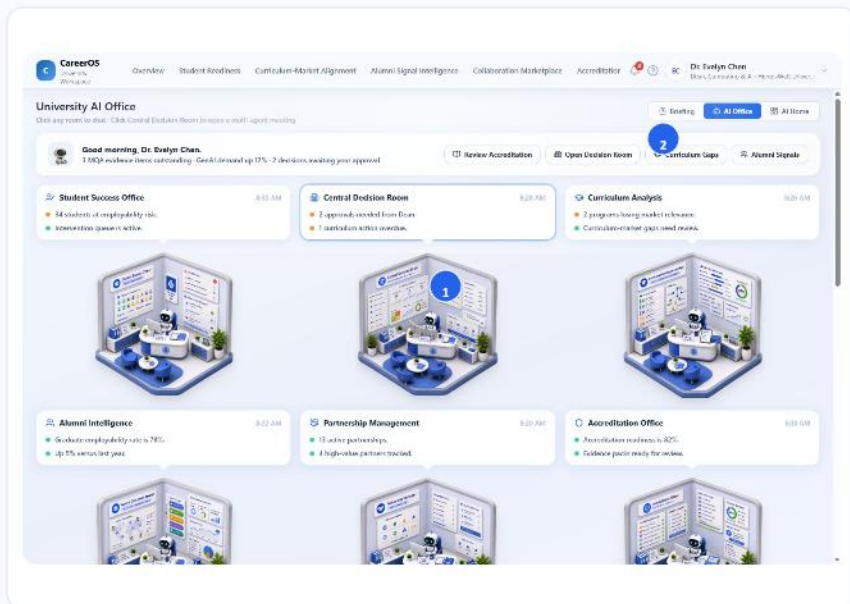

Leaders need prepared decisions—not another page of charts.

GOAL → HUMAN DECISION

The AI Office reframes institutional intelligence as job-shaped work with approval.

- 1 Route goals to Student Success, Curriculum, Alumni, Partnerships, or Accreditation.
- 2 Prepare context and trade-offs across functions.
- 3 Require human approval before external effect.

Interaction model demonstrated; persistent autonomous work is future.

CareerOS becomes more than three workspaces when evidence survives the handoff.

Solid handoffs are represented in the repository. Dashed propagation requires permissions, provenance, and integrations.

Potential moat: permissioned longitudinal evidence and relationship history—not dashboards or generic AI.

The prototype proves product logic—not adoption, accuracy, or integration.

DEMONSTRATED

Working prototype interactions

Three compiled workspaces; rich local interactions; selected cross-page state; partial FastAPI routes; evidence-to-action UX.

Inspect today

SIMULATED

Intelligence and operational effects

Recommendations, scores, cohort and candidate data, sends, exports, uploads, generated drafts, and most persistence.

Label clearly

FUTURE

Production trust and network

Permissions, provenance, verification, integrations, validated models, cross-organisation propagation, and autonomous monitoring.

Validate next

No customers, partnerships, adoption, measured outcomes, ROI, or AI accuracy are claimed.

CareerOS could extend Talentbank from episodic transactions to relationship infrastructure.

STUDENTS

Engage before, between, and after applications through evidence, guidance, practice, and community.

EMPLOYERS

Add evidence-led discovery, warm-pipeline recovery, and engagement design to listings.

UNIVERSITIES

Add readiness, alignment, collaboration, outcome, accreditation, and decision workflows.

ECOSYSTEM

Compound permissioned evidence and relationship history across repeated interactions.

Strategic condition: data rights, distribution, buyer demand, consent, trust, integration cost, and ownership must be validated.

Prove one repeated workflow before scaling the network.

VALIDATION HYPOTHESIS

Can one computing/data faculty detect two employability gaps, launch a current-cohort intervention, capture student evidence, and produce a reusable summary?

Recommended path—not an announced pilot or partnership.

MEASURE TO LEARN—NOT TO CLAIM

- 1 Career Memory evidence completion
- 2 Intervention uptake and completion
- 3 Employer participation
- 4 Time from signal to assigned action
- 5 Staff time to prepare an evidence summary

Decision gates: consent, buyer ownership, data availability, adoption, and operational value.

**Remember the signal.
Prove it.
Act earlier.
Learn.**

The evidence memory and action layer between education and employment.

Prototype • network to validate

STUDENTS

Preserve evidence and choose clearer next actions.

EMPLOYERS

Retain context and make explainable talent decisions.

UNIVERSITIES

Act on gaps while there is still time to change the outcome.
